Professional Summary

Fresh Computer Science Graduate focused on Python backend development with Django and Django REST Framework. Built API-focused projects using PostgreSQL, Redis, Celery, JWT authentication, role-based access control, WebSockets, and API documentation. Seeking a junior backend role focused on API development, database design, and maintainable server-side systems.

Technical Skills

Languages:	Python, JavaScript, SQL
Backend:	Django, Django REST Framework, Django Channels, Celery, SimpleJWT, REST APIs, WebSockets
Databases & Tools:	PostgreSQL, MongoDB, SQLite, Redis, ChromaDB, Docker, Git, Postman, Swagger/drf-yasg, Celery Beat
Concepts:	Authentication, role-based access control, ORM optimization, asynchronous tasks, database transactions, API documentation
Frontend:	HTML5, CSS3, JavaScript, Tailwind CSS

Relevant Experience

Full-Stack Python Developer Trainee, Information Technology Institute (ITI) *July 2025 – August 2025*

- Developed full-stack web features using Python, Django, JavaScript, and the MVT architecture pattern.
- Worked with session-based authentication, forms, views, templates, models, and database operations.
- Improved Django ORM queries using selective field loading, indexing, and relationship prefetching.
- Integrated third-party REST APIs and participated in sprint planning, code reviews, and iterative delivery.

Education

Bachelor of Science in Computer Science, Tanta University – Faculty of Science *2022 – 2026*

GPA: 3.1 | Computer Science Department

Selected Projects

Online Auction System (OSA) – Backend Developer github.com/Abdelrahman74S/OSA

Tech: Django, Django REST Framework, Django Channels, Redis, Celery Beat, PostgreSQL

- Built a real-time auction backend with WebSocket-based bid updates using Django Channels and Redis.
- Used atomic transactions and row-level locking to reduce bid conflicts during concurrent updates.
- Automated auction start/end events with Celery Beat and improved ORM access with `select_related`/`prefetch_related`.

PodStream – Streaming API Platform – Backend Developer

Tech: Python, Django, DRF, MongoDB, ChromaDB, Redis, Celery, MinIO / AWS S3, Docker, Prometheus

- Optimized API latency by implementing Redis caching and smart cache invalidation for heavy aggregation reports, reducing response times from ~2.5 seconds to under 50 milliseconds (a 98% reduction in latency).
- Designed and applied MongoDB indexes and unique constraints on high-frequency tables (listening histories), speeding up query execution times by 80% under simulated heavy load.
- Migrated audio metadata extraction, transcription, and vector embedding syncing to Celery background tasks, reducing API request-blocking time to 0 milliseconds and increasing server throughput.
- Achieved a 99.9% transcription success rate against external API rate limits by configuring Celery task auto-retry policies with exponential backoffs.
- Developed an IP and user-based deduplication algorithm with a 7-day Redis TTL cache, ensuring 100% accurate unique listener metrics and preventing analytics inflation.

Product Review System (PRS) – Backend Developer

github.com/Abdelrahman74S/PRS

Tech: Django, Django REST Framework, Redis, PostgreSQL

- Developed a REST API for product reviews, user profiles, authentication, and review management.
- Added Redis-backed caching and Django Signals for automatic profile creation after registration.
- Implemented request throttling and rate limiting to reduce automated API abuse.

StayEase Hotel Reservation System – Full-Stack Developer

github.com/Abdelrahman74S/HRS

Tech: Django, PostgreSQL, Tailwind CSS, JavaScript

- Built a hotel reservation app for room browsing, booking management, and guest administration.
- Implemented guest/manager roles, availability search, reservation status tracking, and Tailwind CSS pages.

Volunteering

Media Team Volunteer, EVE Youth Organization

2024 – 2025

Created and distributed digital content for social media outreach and organization visibility.
